What is “Cadeka Certification”?

“Cadeka Certification” is a promise, a guarantee that certifies that products you purchase from us, that carry the Cadeka Certification seal, meet the *Original* Design Specifications from the original designing manufacturer. Each part is manufactured and tested to the original manufactures specifications and the functionality and performance meet the original characterization.

How do Replacement Parts receive the Cadeka Seal?

Only products in which Cadeka Microcircuits has acquired all the required assets, tooling, intellectual property, and access to the supply chain, needed to continue manufacturing the components to the exact specifications, receive the Cadeka Seal.

Through a series of acquisitions and asset purchases, Cadeka Microcircuits has secured the original design, specifications, die, substrate, manufacturing, test equipment, and Intellectual Property needed to source, test, and manufacture high quality replacement products. In many cases, even the same people, using the same processes and equipment, at the same location, manufacture the products for you. For more information, please visit the “history” and “who are we” sections of this web site.

Why is the Cadeka Seal important to me?

In today’s world of Internet distribution, fragmented pockets of product, brokers, and poor “knock-offs”, how can you be sure of what you are actually receiving? How can you purchase product with confidence knowing that you will not have a problem? The answer is simple; go to the source who has the original equipment and original testing capabilities, using the same processes, to produce a product guaranteed to meet original performance parameters.... why take a chance?

Would you be willing to put this Certification in writing?

Absolutely. If your company requires additional supporting documentation such as lot tractability, certification, or other information; please give us a call.
